

Getting Started With Logic

SurveyGizmo logic features allow you to customize your survey for each respondent, saving them time and you bad data. Logic can be applied to questions, options, pages, and actions. In this tutorial we'll get you started using logic. We'll cover the most common scenarios for using logic, the best tool for each scenario and how to set it up!

Scenario 1: You have a question in a survey that you only want show to respondents based upon some condition or combination of conditions; for example, how they answered a previous question. [Learn how to set up Question Logic.](#)

Scenario 2: You have an entire page in a survey that you only want to show to respondents based upon some condition or conditions. [Learn how to set up Page Logic.](#)

Scenario 3: You want to disqualify a respondent or skip them ahead in your survey based upon some condition or conditions. [Learn how to set up Skip/Disqualify Logic.](#)

Conditions that logic may be based upon

When logic is processed, a decision is made whether or not to show the element containing that logic. What that decision is based upon is your logic condition: this can be the respondent's answer to **Previous Questions**, for example.

This can also be many other factors, including:

- **System Data** - Time Taken on Survey (in seconds), Current Date, Is Mobile (true/false)
- **Geo Tracking Data** - IP Address, Country, Region, Postal Code, City
- **First Party Data** - URL Variable*, [SSO Variable](#)
- **Email Invite Data** - Contact ID, Email Address, First Name, Last Name, Organization, Department, Division, Team, Group, Role, Is Manager, Home Phone, Fax Number, Business Phone, Mailing Address, Mailing Address 2. City, State/Region, Postal Code, Country, Title, Custom 1-10. [Learn more!](#)

***URL Data** can also be used as a condition, meaning a [URL variable](#) that has been appended to a respondent's link.

Something important to keep in mind when designing your survey's structure and logic

conditions, is that your logic condition must be available at the time the logic is being processed. For example, if you wish to base Page Logic off of a Previous Question, that question must be on a previous page, so that way the respondent's answer to that question has been recorded already.

Each type of logic behaves slightly differently in this regard, allowing for a wide range of flexibility with your logic.

Question Logic is processed dynamically, which means basing logic off of a Previous Question on the same page is allowed. If a condition is on the same page, it must come before the question you are applying the logic to.

Page Logic is processed as the page is being loaded. After the logic has been processed, it will not be re-processed, unless the user/respondent attempts to load that page again (for example, if a respondent were using the "Back" button to go back and change their answers).

Skip/Disqualify Logic is processed as the page is being submitted. Conditions may be on that same page, because the answers will be recorded before processing the logic.

Only show a question based upon the answer to a previous question

For example, in the below survey we ask survey respondents if they will be attending an event. The second question in the survey asks for contact information. We only want to ask respondents to provide contact information if they answer "Yes" to the previous question.

1. Will you be attending the conference?

Yes

No

2. Please provide your contact information below.

First Name

Last Name

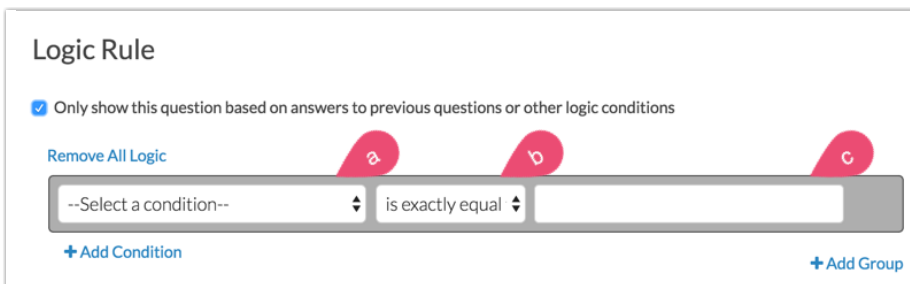

Email Address

Phone Number

Only ask this question of respondents who answer "Yes" to the first question: "Will you be attending the conference?"

To set this up we will use [Question Logic](#) on the question we wish to conditionally show (a.k.a the target question).

1. Edit the target question that you wish to conditionally show.
2. Go to the **Logic** tab and click the option under **Logic Rule** to **Only show this question based on answers to previous questions or other logic conditions**.
3. Using the logic builder, set up the logic condition(s). Logic rules are generally set up as "If/Then" rules, where "If" a certain condition is met, "Then" there is a logical consequence, or reaction from SurveyGizmo.

The screenshot shows the "Logic Rule" configuration window. At the top, there is a checked checkbox labeled "Only show this question based on answers to previous questions or other logic conditions". Below this is a "Remove All Logic" link. The main area contains a logic builder interface with a dropdown menu on the left showing "--Select a condition--", a central operator dropdown showing "is exactly equal", and an empty text input field on the right. Three red circular callouts labeled 'a', 'b', and 'c' are positioned above the dropdown, operator, and input field respectively. At the bottom left is a "+ Add Condition" link, and at the bottom right is a "+ Add Group" link.

a. First, select a question from the current page or a previous page that will be used in the IF part of the rule. In the case of a grid question, you will choose a specific row of the grid to use.

b. Next, select the operator that will be used to evaluate the question. After you select your question, the system will apply the recommended operator for the question type you selected. For example, if the question you selected has preset answers, such as a radio button question, SurveyGizmo will switch to the operator "is one of the following answers" along with a list of the possible answers from your selected question:

Only show this question based on answers to previous questions or other logic conditions

Remove All Logic

Q 1. Will you be attending the confel ▾ is one of the foll ▾ Yes
 No

+ Add Condition

c. Finally, enter the value or values that are required to complete the rule.

The above pictured rule can be read as, "If Question #1, 'Will you be attending the conference?' is Yes, then show the question."

4. Click **Save Question**.

When you set up a logic rule like this you are setting up the conditions for when, and only when, this question will be shown. Once you save, this question will be hidden by default and will ONLY show when the conditions you set up are met.

When we preview the page we can confirm that the follow up question "Please provide your contact information below." is hidden by default.

1. Will you be attending the conference?

Yes

No

Only show an entire page based on the answer to a previous question

For example, on an earlier page in the below survey, we ask survey respondents if they will be attending our conference. We have a series of follow up questions that only apply to those respondents who will be attending the event.

2. Please provide your contact information below.

First Name Last Name

Email Address

Phone Number

Only ask these questions of respondents who indicated that they are attending the conference on Question 1 (asked on a previous page).

3. Do you have any dietary restrictions that we should be aware of?

4. Would you like information about lodging options?

We could set up question logic for each question OR we could set up the logic rule once by using [Page Logic](#). So, we will move all of our questions for respondents who will be attending the conference, to a following page.

1. Edit the page you'd like to conditionally display.
2. Go to the **Logic** tab and set up your logic conditions using the logic builder under **Logic Rule**.

a. First, select a **question** from the current page or a previous page that will be used in the IF part of the rule. In the case of a grid question, you will choose a specific row of the grid to use.

b. Select the **operator** that will be used to evaluate the question. After you select your question, the system will apply the recommended operator for the question type you selected. For example, if the question you selected has preset answers, such as a radio button question, SurveyGizmo will switch to the operator "**is one of the following answers**" along with a list of the possible answers from your selected question:

c. Finally enter the **value or values** that are required to complete the rule.

The above pictured rule can be read as, "If Question #1, 'Will you be attending the event the conference?' is Yes, then show the page."

3. Click **Save Page** and test that your logic is set up.

When you set up a page logic rule like this you are setting up the conditions for when, and only when, this page will be shown. Once you save, this page will now be hidden by default and will ONLY show when the conditions you set up are met.

To confirm, we'll need to preview from the source question "What kind of pet is it?" If we answer "Dog," the About Your Dog page will display. If we answer anything other than dog, the page will be hidden by default.

Check out our [Page Logic Tutorial](#) to learn more!

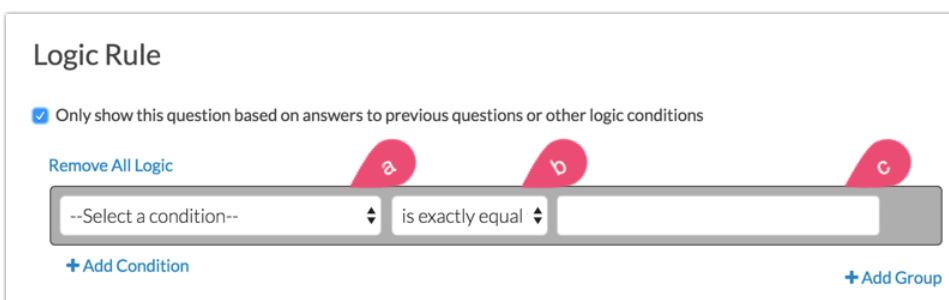

Skip respondents to a later page in the survey based on the answer to a question

For example, the first question in our pet survey asks "Will you be attending the conference?" Respondents who answer "No" will be skipped to the Thank You Page as the rest of the survey does not apply to them.

To add Page Logic click **Skip/Disqualify Logic** below the page.

Using the logic builder, set up the **Logic Conditions**

a. First, select a **question** from the current page or a previous page that will be used in the IF part of the rule. In the case of a grid question, you will choose a specific row of the grid to use.

b. Select the **operator** that will be used to evaluate the question. After you select

your question, the system will apply the recommended operator for the question type you selected. For example, if the question you selected has preset answers, such as a radio button question, SurveyGizmo will switch to the operator **"is one of the following answers"** along with a list of the possible answers from your selected question:

The screenshot shows a 'Logic Conditions' panel. At the top, there is a 'Remove All Logic' link. Below it, a grey box contains a logic rule: 'Q 1. Will you be attending the conference?' is followed by a dropdown menu showing 'is one of the following answers'. To the right of this dropdown are two radio buttons: 'Yes' (unselected) and 'No' (selected). Below the grey box is a '+ Add Condition' link.

c. Finally enter the **value or values** that are required to complete the rule.

Next select what you would like to do if the logic passes. You can select to send a respondent to a specified Survey Page or to an External URL. You can also select to mark the response as complete or disqualified.

This section is titled 'If the Logic Passes, send the respondent to'. It has two radio buttons: 'Survey Page #' (selected) and 'External URL' (unselected). Below the 'Survey Page #' radio button is a dropdown menu with the text '3: Thank You!'.

The above pictured rule can be read as, *"If Question #1, 'Will you be attending the conference?' is No, then jump to survey page 3: Thank You!"*

This is a summary box for the logic rule. It is titled 'Skip/Disqualify Action' and 'Skip / Disqualify Logic'. It contains an 'IF' condition: 'The answer to Question Will you be attending the conference? #1 is one of the following answers No'. This is followed by a 'THEN' action: 'Jump to page 3 - Thank You!'. On the right side of the box, there are two buttons: 'Edit' and 'Remove'.

You can confirm your logic set up on the Build tab of your survey. To test, you will need to preview from the source question "Will you be attending the event?" if you answer "No" and submit the page you will be skipped to the Thank You Page.

Best Practice Tips

- **Use Question or Page Logic over Skip Logic wherever possible.** Skip Logic is best kept at a minimum; it can get pretty confusing to get logic set up the way you want when there are too many skips happening in your survey.
- **Only use the "is exactly equal to" operator or the "is not exactly equal to" operator with text fields.**
- **Avoid negative logic.** It can be pretty difficult to wrap your head around all this logic and to get it set up correctly. If you do choose to use negative logic check out our tutorial on [Understanding Negative Logic](#).
- **If you are using multiple conditions, use groups.** Visit our [Using Multiple Conditions and Groups in Logic Rules](#) article to learn more!
- SurveyGizmo logic is based on the reporting values that are assigned to your answer options. If you have identical reporting values for any two or more answer options, the logic condition will not be able to differentiate between the answer options.
