

SPF Records

An SPF record stands for a Sender Policy Framework, which is an open standard created to stop forgery of from email addresses by spammers. An SPF record helps mail servers distinguish forgeries from real mail by making it possible for a domain owner to say, *I only send mail from these machines*. That way, if any other machines try to spoof mail from that domain, the mail server knows that the FROM address is forged.

For example: Let's say you send an email invite in SurveyGizmo from You@Yoursite.com to AwesomeRespondent@yahoo.com. Yahoo would get the message and say, "OK; this email says it's from Yoursite.com... but wait, it actually came from SurveyGizmo!" Yahoo's email server would then contact Yoursite.com and ask if SurveyGizmo has *permission* to send messages in their name.

For more detailed information about SPF records, please refer to:

When should I use one?

An SPF record is generally used when your company is trying to avoid people using your domain for SPAM. The thing you need to do if you plan to send emails from your SurveyGizmo account, using either the [Send Email Action](#) or [Email Campaigns](#), is to make sure that *if you do have an existing SPF record* that we are included.

Whitelisting us will allow you to use your domain as the **From Address** field when using the SurveyGizmo application to send out email campaigns or send email actions. You will also need to implement DKIM as part of this process.

Learn about setting up SPF and DKIM records in SurveyGizmo by visiting

our [Custom Email Settings](#) tutorial.

What should I avoid?

If you already have an SPF record or are setting one up, you'll want to make sure you don't set it to allow only SurveyGizmo. If you do, then you won't be able to send out emails from any other servers.

If I have an SPF record and need to whitelist SurveyGizmo, what should I use?

If you already have an SPF record set up on the domain you want to send emails from, then we recommend adding the following entry to your SPF record.

```
v=spf1 include:app.sgizmo.com ~all
```

This will include our servers in your preferred server list, and if we ever need to change our specific IP addresses, you won't need to worry about it on your end.

You may also want to whitelist Mandrill which is the email service we use to send application emails, such as, reset password emails. If you are having trouble receiving these emails, you may want to whitelist them. Check out Mandrill's documentation on how to whitelist:

<http://help.mandrill.com/entries/39716883-How-can-my-recipients-whitelist-Mandrill-s-IP-addresses->

If I do need to set up an SPF record, how do I do so?

Here are is a great resource on setting up a valid SPF DNS record:
